

Sentiment Analysis System – Siddhartha Sen

WHAT

- 1.It is a Natural Language Processing Application which can analyse the sentiment on the text given by the user either through Feedback, Survey, Forms etc.**
- 2.This application will predict the sentiment into 3 categories which are Positive , Negative and Neutral .**
- 3.This application will access the data from a Google Form through a Google Sheet.**
- 4.This will be a Web Application which can be utilised into a Local Area Network.**

WHY

- 1.This Project has wide range of application such as Product/Service Monitoring, Surveys regarding a topic,event, personalities and comments.**
- 2.This Project increases the opportunities for those who want to improve their career as a Data Professional.**

HOW

Backend :

Google API

**Google Sheets connected to Google Forms – Data
Collection/Organization**

Vadersentiment – for Data Analysis

Plotly – Data Visualization

Frontend :

Google Form

Streamlit

Google Sheets with Python

1. Google Account - Google Project - We will use Google Sheets API .
2. Visit Google Cloud Console .
3. Create a new Google Project and select it .
4. Enable the Google Sheets API .
5. Configure consent screen.
6. Create a key and download it .

To use google on a python program we need to install 2 libraries.

`pip install google_auth_oauthlib (for verification)`

`pip install google_api_python_client (for importing and exporting data)`

Code :

```
from google_auth_oauthlib.flow import InstalledAppFlow #for verification
```

```
from googleapiclient.discovery import build #for data importing and exporting
```

```
import pandas as pd
```

```
#for Permission of the user , can we use his account
```

```
#to take data from him.
```

```
f=InstalledAppFlow.from_client_secrets_file('key.json',['https://www.  
googleapis.com/auth/spreadsheets'])
```

```
cred=f.run_local_server(port=0) # For taking permission
```

```
# Now we need data.
```

```
# To create a service.
```

```
service = build('Sheets','v4',credentials=cred).spreadsheets().values()
```

```
#Sheets is the service name and v4 is the version name.
```

```
# Retrieve Data From Google Sheets.
```

```
d = service.get(spreadsheetId='1znSi1Pc-u1gQR35-  
HwJEnYKLyAshwkQt36QqXjZe5hA',range='A1:H').execute()
```

```
# A1:H , no number in front of H because data will keep getting added  
continuously in real
```

```
# time.
```

```
mycolumns = d['values'][0]
```

```
# 0 index is the 0th row of our data i.e. headings.
```

```
mydata = d['values'][1:] # data from 1st index i.e. from 1st row to last
```

```
# under headings.
```

```
df = pd.DataFrame(data=mydata,columns=mycolumns)
```

To use vadersentiment we need to install 2 packages :

pip install nltk (full form - natural language toolkit)

pip install vaderSentiment

Code:

```
from google_auth_oauthlib.flow import InstalledAppFlow #for verification
```

```
from googleapiclient.discovery import build #for data importing and exporting
```

```
import pandas as pd
```

```
#for Permission of the user , can we use his account
```

```
#to take data from him.
```

```
f=InstalledAppFlow.from_client_secrets_file('key.json',['https://www.googleapi  
s.com/auth/spreadsheets'])
```

```
cred=f.run_local_server(port=0) # For taking permission
```

```
# Now we need data.
```

```
# To create a service.
```

```
service = build('Sheets','v4',credentials=cred).spreadsheets().values()
```

```
#Sheets is the service name and v4 is the version name.
```

```
# Retrieve Data From Google Sheets.
```

```
d = service.get(spreadsheetId='1znSi1Pc-u1gQR35-  
HwJEnYKLyAshwkQt36QqXjZe5hA',range='A1:H').execute()
```

```

service = build('Sheets','v4',credentials=cred).spreadsheets().values()
```

```
#Sheets is the service name and v4 is the version name.
```

```
# Retrieve Data From Google Sheets.
```

```
d = service.get(spreadsheetId='1__iW-o_wfw4XeAN4m8RnrxYq0q-Z1d-JGlcF_C_ShTM',range='A1:B').execute()
```

```
# A1:B , no number in front of B because data will keep getting added continuously in real
```

```
# time.
```

```
mycolumns = d['values'][0]
```

```
# 0 index is the 0th row of our data i.e. headings.
```

```
mydata = d['values'][1:] # data from 1st index i.e. from 1st row to last
```

```
# under headings.
```

```
df = pd.DataFrame(data=mydata,columns=mycolumns)
```

```
l=[]
```

```
# To get values from an individual column one by one
```

```
for i in range(0,len(df)):
```

```
    k = df._get_value(i,'review')
```

```
    pred=mymodel.polarity_scores(k)
```

```
    if(pred['compound']>0.5):
```

```
        l.append("Positive")
```

```
    elif(pred['compound']<-0.5):
```

```
        l.append("Negative")
```

```
    else:
```

```
        l.append("Neutral")
```

```
# We will convert this new list by the name of 'l' into a column which we can store in a
```

```
# dataframe .
```

```
df['Sentiment'] = l # By this statement the list 'l' will come under a new column  
# called Sentiment.
```

```
# Exporting this dataframe
```

```
df.to_csv("MobileReview_bymachine.csv",index=False) # We dont want the  
index inside a csv file hence false.
```

To visualize percentage of positive , negative and neutral values, we have to install plotly package.

pip install plotly

For calculating the percentage of positive ,negative and neutral values , we have performed the following code :

```
from google_auth_oauthlib.flow import InstalledAppFlow #for verification  
from googleapiclient.discovery import build #for data importing and exporting  
from vaderSentiment.vaderSentiment import SentimentIntensityAnalyzer  
import pandas as pd  
import plotly.express as px
```

```
mymodel=SentimentIntensityAnalyzer()
```

```
# to categorize text data as positive , negative or neutral.
```

#for Permission of the user , can we use his account

#to take data from him.

f=InstalledAppFlow.from_client_secrets_file('key.json',['https://www.googleapis.com/auth/spreadsheets'])

cred=f.run_local_server(port=0) # For taking permission

Now we need data.

To create a service.

service = build('Sheets','v4',credentials=cred).spreadsheets().values()

#Sheets is the service name and v4 is the version name.

Retrieve Data From Google Sheets.

d = service.get(spreadsheetId='1__iW-o_wfw4XeAN4m8RnrYq0q-Z1d-JGIcf_C_ShTM',range='A1:B').execute()

A1:H , no number in front of H because data will keep getting added continuously in real

time.

mycolumns = d['values'][0]

0 index is the 0th row of our data i.e. headings.

mydata = d['values'][1:] # data from 1st index i.e. from 1st row to last

```

# under headings.

df = pd.DataFrame(data=mydata,columns=mycolumns)

pos=0

neg=0

neu=0 # for postive , negative and neutral

# To get values from an individual column one by one

for i in range(0,len(df)):

    k = df._get_value(i,'review')

    pred=mymodel.polarity_scores(k)

    if(pred['compound']>0.5):

        pos=pos+1

    elif(pred['compound']<-0.5):

        neg=neg+1

    else:

        neu=neu+1

posper = (pos/len(df))*100 # posper for positive percentage and similarly

negper = (neg/len(df))*100 # negper and

neuper = (neu/len(df))*100 # neuper

print("Positive: ",posper)

print("Negative: ",negper)

```

```
print("Neutral: ",neuper)
```

```
(sentiment) F:\project_sentiment\sentiment\Scripts>python mobilereview.py
Please visit this URL to authorize this application: https://accounts.google.com

%2F&scope=https%3A%2F%2Fwww.googleapis.com%2Fauth%2Fspreadsheets&state=39TGX5Z0G
e
Positive: 46.246246246246244
Negative: 11.01101101101101
Neutral: 42.74274274274275
```

For plotting the pie chart representing the percentage of positive , negative and neutral values , we have downloaded the google sheet where we had the reviews and the rating in the form of a csv file and stored it in our virtual environment by the name of ‘Mobile_reviews.csv’. After that we wrote the code below to execute our objective .

```
from vaderSentiment.vaderSentiment import SentimentIntensityAnalyzer
```

```
import pandas as pd
```

```
import plotly.express as px
```

```
mymodel=SentimentIntensityAnalyzer()
```

```
df = pd.read_csv('Mobile_reviews.csv')
```

```
pos=0
```

```
neg=0
```

```
neu=0 # for postive , negative and neutral
```

```
# To get values from an individual column one by one
```

```
for i in range(0,len(df)):
```

```
k = df._get_value(i,'review')  
pred=mymodel.polarity_scores(k)  
if(pred['compound']>0.5):  
    pos=pos+1  
elif(pred['compound']<-0.5):  
    neg=neg+1  
else:  
    neu=neu+1
```

```
posper = (pos/len(df))*100 # posper for positive percentage and similarly  
negper = (neg/len(df))*100 # negper and  
neuper = (neu/len(df))*100 # neuper  
print("Positive: ",posper)  
print("Negative: ",negper)  
print("Neutral: ",neuper)  
fig=px.pie(values=[posper,negper,neuper],names=['Positive','Negative','Neutral'])  
fig.show()
```

We obtained the above pie chart .

FRONTEND INTERFACE MAKING

We have to install streamlit in our virtual environment.

pip install streamlit . And then type the following code in the main.py file which goes as follows:

We are referring to the code for a mobile phone review over here.

import streamlit as st

from google_auth_oauthlib.flow import InstalledAppFlow #for verification

from googleapiclient.discovery import build

from vaderSentiment.vaderSentiment import SentimentIntensityAnalyzer

import pandas as pd

```
